Pictures Can Be "Seen" by Touch, Is Declaration Made by Inventor of New Fad.

spending a two weeks' vacation from his bists and futurists one by one eclipse

"Tactilism" is the name of a new "art" invented by Signor Marinetti, the Italian futurist, who, recently, to a large audience of painters, art critics and society people in Paris, explained its principles. It is a method of conveying impressions through the sense of touch, "which has hitherto been neglected by the arts."

Marinetti told how he had tried to establish a series of conventions. which could be easily learned, by which different touches would bring forth definite ideas. For instance, something rough, spiky and hot to the touch would give the idea of the Sahara. The seas would be conjured up by something smooth and cold, like silver paper, and Paris by a mixture of silk and velvet. It is an evidence of the readiness of the day to take Cady's Falls, and Miss Nellie Sweet of up anything new that this adventurous futurist ploneer is now the lion of the season. He intends to be in Paris for some weeks, but has already received so many invitations to attend fashionable receptions and evening parties that he confesses that he hardly knows how to cram in all his appointments.

DESIGNED TO UPHOLD WEIGHT

Elephant's Foot Is Enormous, Even When Compared With the Size of the Beast,

That twice around an elephant's foot equals its height seems almost incredible, yet such is the fact, and a little reflection will show you that it is not so wonderful as it appears to be. Things are large or small, comparatively, and if we could see the foot of an elephant by itself, it would present a far different appearance as to size from what It gives when overshadowed by the mountain of flesh it supports. The elephants in the Indian commissariat being dieted according to height require to be measured annually to determine the amount of food to which they are entitled. At present this is done by means of the ordinary standard with crossbar on top, but formerly it was done by placing a rope around the animal's forefoot close to the ground, and multiplying the length so obtained by two. This measurement generally gives a quarter of an inch or so more, but never less than the exact height.

Use of Peat as Fuel.

mines.

For several months a Minneapolis company has been engaged in the prep aration of peat for fuel, said to be the only enterprise of its kind in the country. A machine has been perfected that digs, macerates and spreads out to dry 700 tons of wet peat in a day, or a quantity sufficient to produce 100 tons of dry fuel. That's how much peat contracts in the drying process. One man operates the machine.

and peat, processed at the University of Minnesota, was burned with satisfactory results in a Minneapolis office building.

A crusher plant, with a capacity of 500 tons of peat a day, has been built in Minneapolis during the winter to produce powdered peat, and in the spring ten peat digging machines are to be started on the Minnesota bogs.

LOOK TO FUTURE EXPANSION

Civic Bodies of Kansas City Are Showing a Spirit Well Worthy of Emulation.

Just how valuable it may be to prepare for the orderly development of a city industrially is indicated in a plece of work which is now being undertaken by the city-planning commission and the chamber of commerce of Kansas City. The industrial department of the chamber aims to make a survey of industrial conditions in Kansas City which it may use in its own work, and the planning commission will seek much additional data through the survey which may be used to excellent purpose by various committees of the commission, by the industries themselves and by other agencies concerned with the most busihesslike and systematic expansion of the entire city.

What the planning commission desires to ascertain in this respect is just what the most progressive and far-seeing business man would have in order to make possible the best development of his interests. The commission already has committees at work obtaining facts about Kansas City's present status and probable future expansion in respect to commercial, residential and industrial districts; recreation facilities, highways and transportation conditions; and it has prepared a basic map which makes zoning of the city possible. But the necessity of obtaining such facts as these about the city's industries, as well as the value of the facts, is at once evident:

What industries has the city? What is likely to be the expansion of these periods of ten, twenty or thirty years?

Where will the expansion be? What additional industries is Kansas City likely to have?

Where will they be placed? Where will the additional employees

HOW CITY CONSERVED TREES

Los Angeles Built "Island" Around Unusually Fine Cluster in Path of Grading.

When the city of Los Angeles recently cut North Broadway through Holgate square there was a clump of fine old pepper trees directly in the path of the grading. So the city, rather than cut the trees down, built an "island" around them. An unusual feature of the island is an ornamental drinking fountain which

This Fountain Is a By-Product of Saving the Trees From Destruction by Building an "Island" Around Them.

was built for the purpose of supplying thirsty motorists and pedestrians with a refreshing draught of Adam's ale. The water is piped to the fountain from a street main .- Popular Science Monthly.

School Gardens. Is there ground available for school

gardens? Some schools have rented vacant lots and fields near the school house for their gardens and have succeeded in earning money on them, which has been used for other school projects or equipment. A certain school has an orchard of 100 trees, in which the children are given practical instruction on the care of fruit trees; the profit from the sale of the fruit goes to the school; and the orchard serves as a model for the community.

Is it possible or advisable in your school to have gardens and orchards so managed that they will make substantial contributions to the upkeep of various school activities, and at the same time provide valuable practical laboratory training for the pupils? This is a community problem, which may be solved best, perhaps, by general discussion.

"City Plan" Works Well.

The city plan has been tried in many cities with success. St. Louis and Milwaukee are examples. Under such a plan the city does not repeat obvious mistakes. At present the man who builds a home has no assurance that a filling station will not be his next-door neighbor tomorrow. He may move into another district and later see a factory shut off his light and air. The city plan idea, summed up, is that there is a place for everything and that everything should be in its place. The only way that idea can be made effective is through laws giving the planners the legal right to act .- Exchange.
